

Meeting Protocol Second Meeting - 8/9:

Attendance:

Jakob Wall is excused.
Anne Keller is excused.
All other attending.
Secretary: Jakob Erlandsson.
Moderator: Philip Nord.

Our Backlog:

It feels like our backlog was okay according to the lecture yesterday.
We might want to break our user stories down even further and make them more “vertical”, as well as having some kind of priority.
We also need to assign tasks for each user story.
Kevin is updating Trello as we change them.

First Sprint:

We need something that can be presented to the product owner. (Think vertical slices).
First and easiest seems to be getting the MOPED to actually drive according to the user's input.
This will be our version of presenting “Hello World”.
After that will probably be to collect data from the front sensor and show it somehow.
When we've broken down the stories to tasks we can estimate the time our sprint backlog will take to be completed. Hopefully this will work with our estimated velocity.

What we've done:

This can all be seen on Trello.
Defined acceptance criteria.
Broken down this sprint's user stories into tasks.
We're color coding our tasks and user stories to see what they both relate to.
We split the group into two teams, each working on one story.
Some of the tasks in the stories are similar to each other but this is fine for now since we all need to learn the API and development environment.

We've decided on a score systems for how time consuming tasks should reasonably be. At this point we're mostly guessing though since we have not been working on the MOPED yet. We decided that our velocity is 50, we have to manage our tasks to reach this number since the total effort is now too high.

Definition of Done:

- Material is pushed to GitHub with no conflict.
- Self-written code must be reviewed by a second part.
- New functionality must clear previous test.
- Finished user stories must include relevant documentation for usage/integration.
- User stories should reach AC by demoing.
